Scrapping

Scrapping is a technique of collecting useful data from any website. This is done by requesting to website via codes, in this article we have a trip to scrap Government Jobs, Admit Cards and Results of various exams and entrances from the website https://www.sarkariresult.com/

It is also called web crawling and one who do crawling are termed a Web Bot or Spider.

How spider woks

- Generally it requests to the URL and get response from URL in script (HTML).
- After collecting HTML script it target to the specific tags of html and collect data to which it instructed.
- At last spider serve the scrapped data to their user.

Requirements

- We use python language to make a spider that will scrap the website.
- Library Used in this project:
  - BeautifulSoup
  - Requests
- Requests is an inbuilt library of python so no need to install.
- To install BeautifulSoup open your terminal and run:
  - pip install bs4

Source Code

First import both the library that i mentioned above.

```
from bs4 import
BeautifulSoup
import requests
```

Then assign the URL and make a get request to the URL

```
url =
"https://www.sarkarir
esult.com/"
r = requests.get(url)
```

Load the request in the parameter of BeautifulSoup class

```
soup =
BeautifulSoup(r.conte
nt, 'html5lib')
```

next inspect the target (Results, Admit Cards, Jobs) and make the

separate function block for each. As shown below

Results

```
def Results():
    div =
soup.find('div',attrs
={'id':'box1','align'
:'left'}).find('div',
attrs={'id':'post'}).
find_all("ul")

    for result in
div:
        x =
result.li.a.find_next
('a')
        print(x.text)
```

Jobs

```
def jobs():
    div =
soup.find('div',attrs
={'id':'box1','align'
:'right'}).find('div'
,attrs={'id':'post'})
.find_all("ul")

    for job in div:
```

```
        x =
job.li.a.find_next('a
')
        print(x.text)
```

Admit Cards

```
def admitCards():
    div =
soup.find('div',attrs
={'id':'post','align'
:'left'}).find_all('u
l')

    for admitCard in
div:
        x =
admitCard.li.a.find_n
ext('a')
        print(x.text)
```

Advantages

The biggest advantage of the Spiders is to automate you boring stuff.

Scrap large data less time.

Less human interaction.
